

Models:

A model is a science project that builds a scale or functional model of something. A model should show the components of the whole and give an understanding of how something works or what it is made of. It is making a model of a real world object, the more similar to the actual object, the better the model.

The purpose of a model is to make something that would be easier to study than the real object.

MODEL PROJECTS SHOULD HAVE:

1. A display board with your **name**, **grade**, and a **title**.
2. A **constructed model** of your subject.
3. **Description** of your research and explanation of your model.
4. **Neat presentation** of your information on the display board.
5. **References** neatly listed where you found information.
